I've what i's method overloading in Java Femplain with
an example?
(i) Method overloading is multiple methods in
the same class with the same name but different
Parameters.
(1) Method overloading l'noreases code's
reader readability and reusability
(111) Inorder to overload the method we have
to give different parameter or diffierent
data types of parameter or change
the sequence of the parameters to overload
the method.
2) What are the rules for method overloading
resolution in Java? How does Java determine
which overloaded method to cau?
<i>→</i>
Rules for Method overloading Resolution
in Java:
(1) To overload a method we have to
consider & give parameters in Aus manner!-
-> Number of parameters
- Data type of pararameter.
→ sequence of data type of parameter
(i) compile time Resolution, ->
The compiler decides which
overloaded method should it make
based on parameter arguments provided
by user.

- (93.) What does the static keyword mean in Javo? Emploin the different between static & non-Static methods.
 - A) Static keyword Java :
 ① Static keyword 19 a nan-access modifier

 wed for methods, variables, blocks, & nested

 Classes. It I'ndicates that a particular member

 belongs to the class itself rather than

 to Instances of the class.
 - Distatic variables and methods are abouted memory space only once during program execution. This memory space is shared among au Instances of the class making static members useful for maintaining global state or shared functionality.

(11) static members can be acressed without
the need to Create on Instance of the class
this makes them wefer for providing utility
functions and constants that can be used
across the entime program.

- (10) Steeti'c members are associated with the class, not with lindividual obviects. Changes to a static member are reflected in all Instances of the class, and static members can be accessed using the class name mather than an object refrence.
- P static methods & variables cannot access

 non-static members of a class, as they

 are not associated with any particular

 instance of the class, steetic methods can be

 overloaded but not overidden because they

 are associated with the class rather than

 with a specific Instance.

B> Difference bet Static & Non-static

- D Accessibility:
 -) Static methods can be accessed during
 using class names, while non-static
 methods require object Instances for
 access
- Memory Allocation:

 Static methods are culocated.

 memory only when the class is loaded

 while non-static methods have memory

95) (on static methods be overloaded and.
overnidden in Jana 9. How are Static
variables shared across
multiple instances of a class?
(a) Static Methods overloading & overriding!-
→ overloading: - Yes Static methods can be
overloaded in Jora Method myorloadis

the same name but different parameters
within the Same Class.
-> overriding :->
No static methods can not be
overridden in Java. Static methods.
are associated coith the class itself
rather than with Instances so they are
not subject to polythouphic behaviour.

B) Shaming of Static variables!
1) Shared Memory Allocation ->

2) Global state:
All Instances of a class share the same

functionality.
(3) Isolation:
Each Instance of a class within a
different class loader 1's distinct,
different class loader is distinct, meaning that static variables are
Sharred among Instances within the
game class toader but Isolated across
different class loader.

(26) what is the significance of the final
Keyword I'n Java ?
(i) when a variable 119 declared as
'final' 1+'s volue cannot be changed
once initialitéed making it's a
Constant.
(11) Find final variables are commonly
(B) wed to declare constants that showed a

(ii) the naming convention for final
vaniables i'n Java l's to use upper case
Variables l'n Java l's to use appearance à letters with underscomes to separate
words.
(N) A method declared as final cannot
be overridden by a subclass.
(v) tind methods one wetch for a trining
methods that are part of a class's
public API and Should not be modified
by subclasses.
a) final classes:
→ A classes manked as final' caprot : be inherited by another class:

(b) Initialization >

-> final variables must be Initialized
either at the time of declaration or in the

constructor of the classes. This ensures

that the value of the final variable is set
and cannot be changed.

(c) performance & Security >>

The use of 'final' can sometimes

Improve performance as the compiler can

optimite the code more effectively when

variables or methods are marked as final,

'final' can einhance Sewrity by preventing

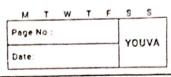

molicious code from modifying sensitive

data or behaviour.

D) Code Quality:
By declaring variables, methods & classes as 'fina' developers can write more secure, robust, & maintainable code

It ensures that Certain aspects of a program remain unchanged, promoting stability & men reliability.

QT) Can a final method be overridden in a
Subclass & How does the final keyword affect
variables, methods, & classes in Jana 9
A) A final method cannot be overridden
in a Subclass, & The 'tinal' keyword
applied to a method prevents it from
being overmidden by any subclass,
ensuring that the method's implementation
remains unchanged.
Vending and
B) Impact of final keyword' -
D/ 111190000
(1) Vomiobles! -
-> final variables, once l'nitialite d.,
corrot be reassigned a new value.
- Final variables are constants and are
typically declared in upper case with.
underscores to seperate words.
- Bank final Variables must be
initialized in the Constructor to avoid
Compilation errors.
(2) Methods'-
-> Firal Methods Connot be overridden
by subclasses, maintaining the method's
behaviour across inheritante.
-> final methods are useful for defining
methods that should not be modified
or extended in Subclasses.

3 classes:
-> final classes cannot be entended by other
classes, preventing inheritance
-> Fina classes are beneficial when a
class i's designed to be used as i's
without modification or extension.
(Q8) what does this keyword represent i'n
Java? How is the this keyword wed in
Constructors & methods 9
a) This keyword in Jana represents
the current obsect on Instance of a
olas.

1) Norrecolling Conversions:

- From broder datt data types to narrower data types, which can result in loss of information about the overall magnitude of numeric value.
- Duming normowing Convensions, Jour may lose precision range, or both, depending on the data types involved.
- -> for example, when converting from
 double to flood Jove to llows the rounding
 nules which can lead to precision
 loss & mange issues
 - Java ensures that even though precision loss may occur during narrowing.

 Conversions, they do not result in runtine exceptions.
